

A Project in the ITL Pervasive Computing Portfolio

Applying ADLs to Assess Emerging Industry Specifications for Dynamic Discovery of Ad Hoc Network Services

Christopher Dabrowski and Kevin Mills

**DARPA PI Meeting
January 31, 2001**

Project Goals

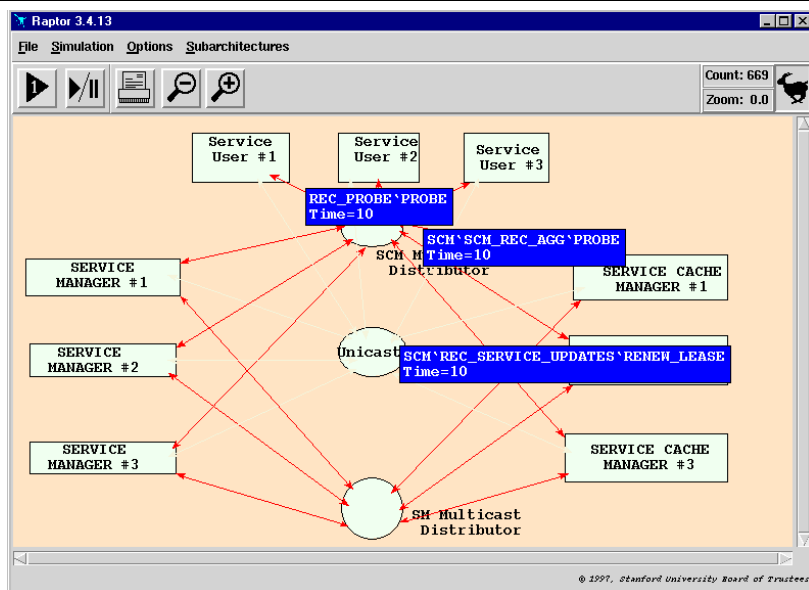

- 1) Use ADLs and associated tools to **analyze Discovery Protocol specifications** to assess consistency and completeness wrt dynamic change conditions—provide basis for gauges.
- 2) **Compare and contrast emerging** commercial service **discovery technologies** with regard to function, structure, behavior, performance and scalability in the face of dynamic change.

Presentation Topics

- Planned Approach to Modeling and Analysis and Current Status
- Technical Discussion of Initial Progress
 - Generic and Specific UML Models Encompassing Jini, UPnP, & SLP
 - *Rapide* Model for Jini (90% complete)
- Upcoming Milestones and Planned Publications

Modeling Function, Structure, and Behavior

Objectives

- (1) Provide increased understanding of the competing dynamic discovery services emerging in industry
- (2) Develop metrics/gauges for comparative analysis of different approaches to dynamic discovery and for analyzing consistency and completeness of discovery protocols
- (3) Assess suitability of architecture description languages to model and analyze emerging dynamic discovery protocols

Technical Approach

- Develop ADL models from selected specifications for service discovery protocols and develop a suite of scenarios and topologies with which to exercise the ADL models
- Propose a set of invariant properties that all dynamic discovery protocols should satisfy
- Propose a set of metrics, based on partially ordered sets, with which to compare and contrast discovery protocols
- Analyze the ADL models for inconsistencies, to assess invariant satisfaction, and to compare and contrast protocols

Status as of January 31, 2001

- Developed a generic UML model encompassing the structure and function of Jini, UPnP, SLP, Bluetooth, and HAVi
- Projected specific UML models for Jini, UPnP, and SLP
- Developed a Rapide Model of Jini structure, function, and behavior (90% complete)
- Drafted a scenario language to drive the Rapide Jini Model; currently being implemented.
- Developed some initial invariants and constraints for Jini behavioral model
- Discovered a number of ambiguities and inconsistencies in Jini Specification V1.1
- Discovered a major architectural issue in the interaction between Jini directed discovery and multicast discovery

1/31/2002

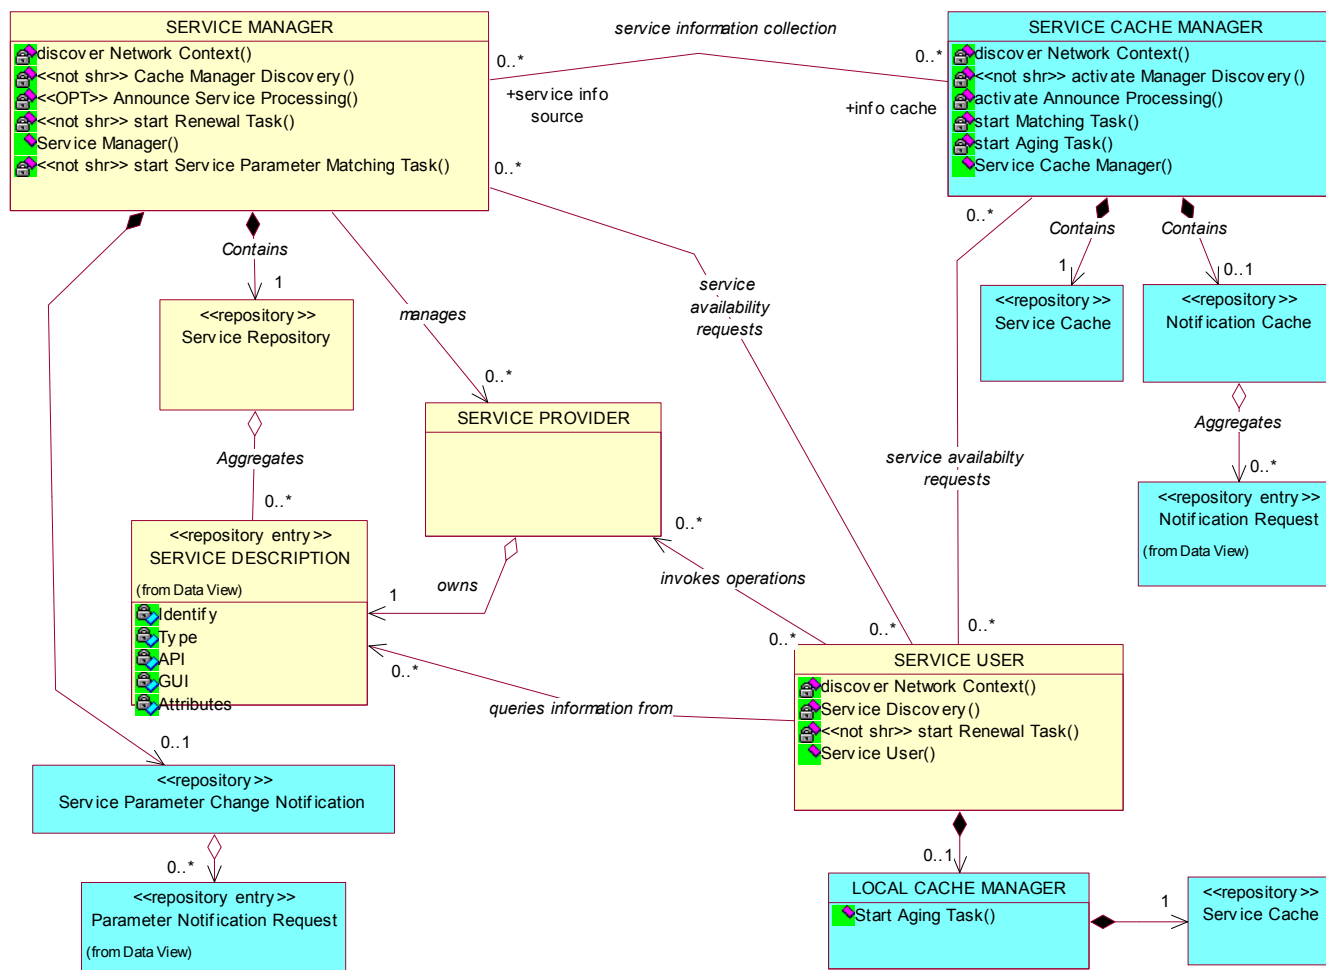

Products

- Rapide specifications of Jini, Universal Plug and Play (UPnP), and Service Location Protocol (SLP)
- Scenarios and topologies for evaluating discovery protocols
- Suggested invariant properties for service discovery protocols
- Suggested metrics, based on partially ordered sets (POSETs), for comparing and contrasting discovery protocols
- Paper identifying inconsistencies and ambiguities in Jini and UPnP and describing how they were found
- Paper proposing invariants for service discovery protocols, and evaluating how Jini, UPnP, and SLP fare
- Paper comparing and contrasting Jini, UPnP, and SLP at the level of POSET metrics

Benefits from Using Architecture, ADLs, & Tools

- **Represent essential complexity** with effective abstractions
- Provide a framework and context
 - to more easily **pinpoint** where **inconsistencies and ambiguities** may exist within software implementing specifications & to understand how they arise
 - to **compare and contrast** different discovery **protocols** (Jini, UPnP, SLP)
 - to **define gauges** that yield qualitative and quantitative measures

Generic UML Structural Model of Service Discovery Protocols

Architecture Description Languages and Tools

Allow us to **model the essential complexity** of discovery protocols, while ignoring the incidental complexity

Jini documented in a 385 page specification; however, the document is static and thus captures only the **normative complexity** because most of the **essential complexity** arises through interactions among distributed, independently acting, Jini components.

Incidental complexity represented by the code: for example consider Core Jini – an 832 page commentary on the massive amount of Java code that comprises Jini, which also depends on complex underlying code for Remote Method Invocation, Distributed Events, Object Serialization, TCP/IP, UDP, HTTP, and Multicast Protocol Implementation.

Rapide, an Architecture Description Language and Tools Developed for DARPA by Stanford

**MODELING
ESSENTIAL
COMPLEXITY**

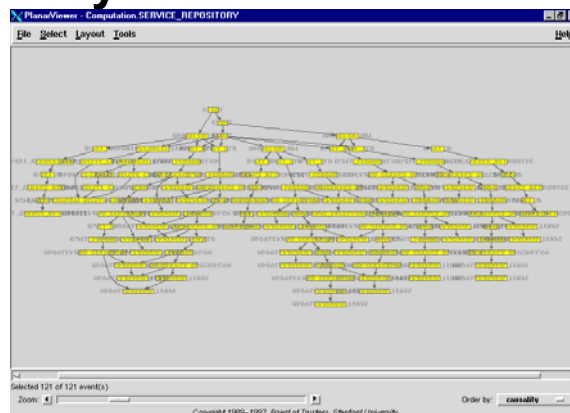

Execute with Raptor Engine

Specification of Rapide Architecture

```
-- *****
-- ** 3.3 DIRECTED DISCOVERY CLIENT INTERFACE **
-- *****
-- This is used by all JINI entities in directed
-- discovery mode. It is part of the SCM_Discovery
-- Module. Sends Unicast messages to SCMs on list of
-- SCMs to be discovered until all SCMs are found.
-- Receives updates from SCM DB of discovered SCMs and
-- removes SCMs accordingly
-- NOTE: Failure and recovery behavior are not
-- yet defined and need review.
TYPE Directed_Discovery_Client
(SourceID : IP_Address; InSCMsToDiscover : SCMList; StartOption : DD_Code;
 InRequestInterval : TimeUnit; InMaxNumTries : integer; InPV : ProtocolVersion)
IS INTERFACE
SERVICE DDC_SEND_DIR : DIRECTED_2_STEP_PROTOCOL;
SERVICE DISC_MODES : dual SCM_DISCOVERY_MODES;
SERVICE DD_SCM_Update : DD_SCM_Update;
SERVICE SCM_Update : SCM_Update;
SERVICE DB_Update : dual DB_Update;
SERVICE NODE_FAILURES : NODE_FAILURES; -- events for failure and recovery.
ACTION
IN Send_Requests(),
BeginDirectedDiscovery();
BEHAVIOR
action animation_lam (name: string);
MySourceID : VAR IP_Address;
PV : VAR ProtocolVersion;
```

Analyze Generated POSETs

**Assess Invariant
Satisfaction &
Constraint
Violations**

Layered View of Prototype JINI Architecture in Rapide

Derived from SEI Architectural Layers Approach

Execute Architecture with the Raptor Engine

Drive Model Topology with Scenarios

- > StartTime {NodeFail || NodeRecover} NodeID DelayTime.
- > StartTime {LinkFail || LinkRestore} NodeID DelayTime FromNode ToNode.
- > StartTime {MProbeFail || MProbeRestore} NodeID DelayTime FromNode ToNode.
- > StartTime {GroupJoin || GroupLeave} NodeID DelayTime.
- > StartTime {AddSCM || DeleteSCM} NodeID DelayTime.
- > StartTime {AddService ChangeService} NodeID DelayTime ServiceTemplate ServiceAPI ServiceGUI LeaseTime DurationTime.
- > StartTime DeleteService NodeID DelayTime ServiceID.
- > StartTime FindService NodeID DelayTime SMNodeID .
- > StartTime AddNotificationRequest NodeID DelayTime NotificationID ServiceTemplate Transitions LeaseTime DurationTime SCMID.
- > StartTime DeleteNotificationRequest NodeID DelayTime NotificationID SCMID.

Analyze Invariant \rightarrow Satisfaction & Constraint Violations in Real-Time

Sample Invariants

⌚ (SM  SD  SCM): (SM,SD) \bowtie SCM registered-services
 \bowtie SCM \bowtie SM discovered-SCMs

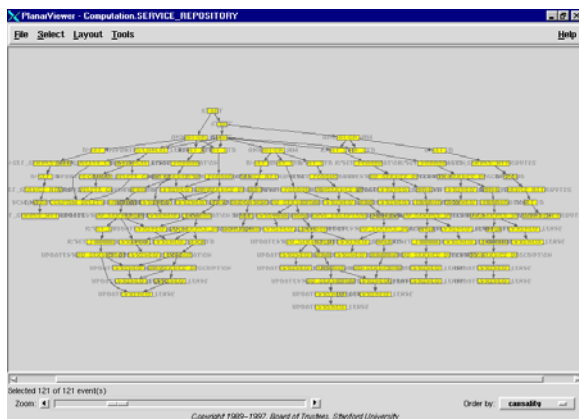

⌚ (SU  NR  SCM): (SU,NR) \bowtie SCM registered-notifications
 \bowtie SCM \bowtie SU discovered-SCMs

- SM is Service Manager
- SD is Service Description
- SCM is Service Cache Manager
- SU is Service User

- NR is Notification Request
- Registered-services is a set of (SM,SD) pairs
- Registered-notifications is a set of (SU,NR) pairs
- Discovered-SCMs is a set of SCM

\rightarrow Invariants provide basis for defining *gauges* that provide qualitative measures of properties of a system

Analyze POSETs → Off-Line to Compare and Contrast Behaviors Given a Congruent Topology and Scenario

Metrics Based on Numbers of Messages

- Message volume?
- Message intensity?

Metrics Based on Complexity

- Degree of dependency among messages?
- Rate of constraint and invariant violations?
- Rate of exceptions?

Metrics Based on Time

- Service latency?
- Service throughput?
- Recovery latency?

Metrics Based on Change

- Derivative of the message intensity?
- Derivative of the service throughput?
- Derivative of the service latency?

→ POSET analyses provide basis for defining *gauges* that provide quantitative measures of properties of a system

Schedule and Milestones

- FY 2001
 - Operational prototype of Jini & UPnP architectures
 - Report showing initial results of analysis of Jini and compare/contrast of Jini & UPnP; recommendations on ADLs.
- FY 2002
 - Formalization of quantitative & qualitative metrics to serve as basis for gauges; formalization of compare/contrast analysis
 - Expansion of operational prototype to incorporate metrics & resulting analysis as well as SLP (other protocols?)
 - Second report on results.

EXTRA SLIDES

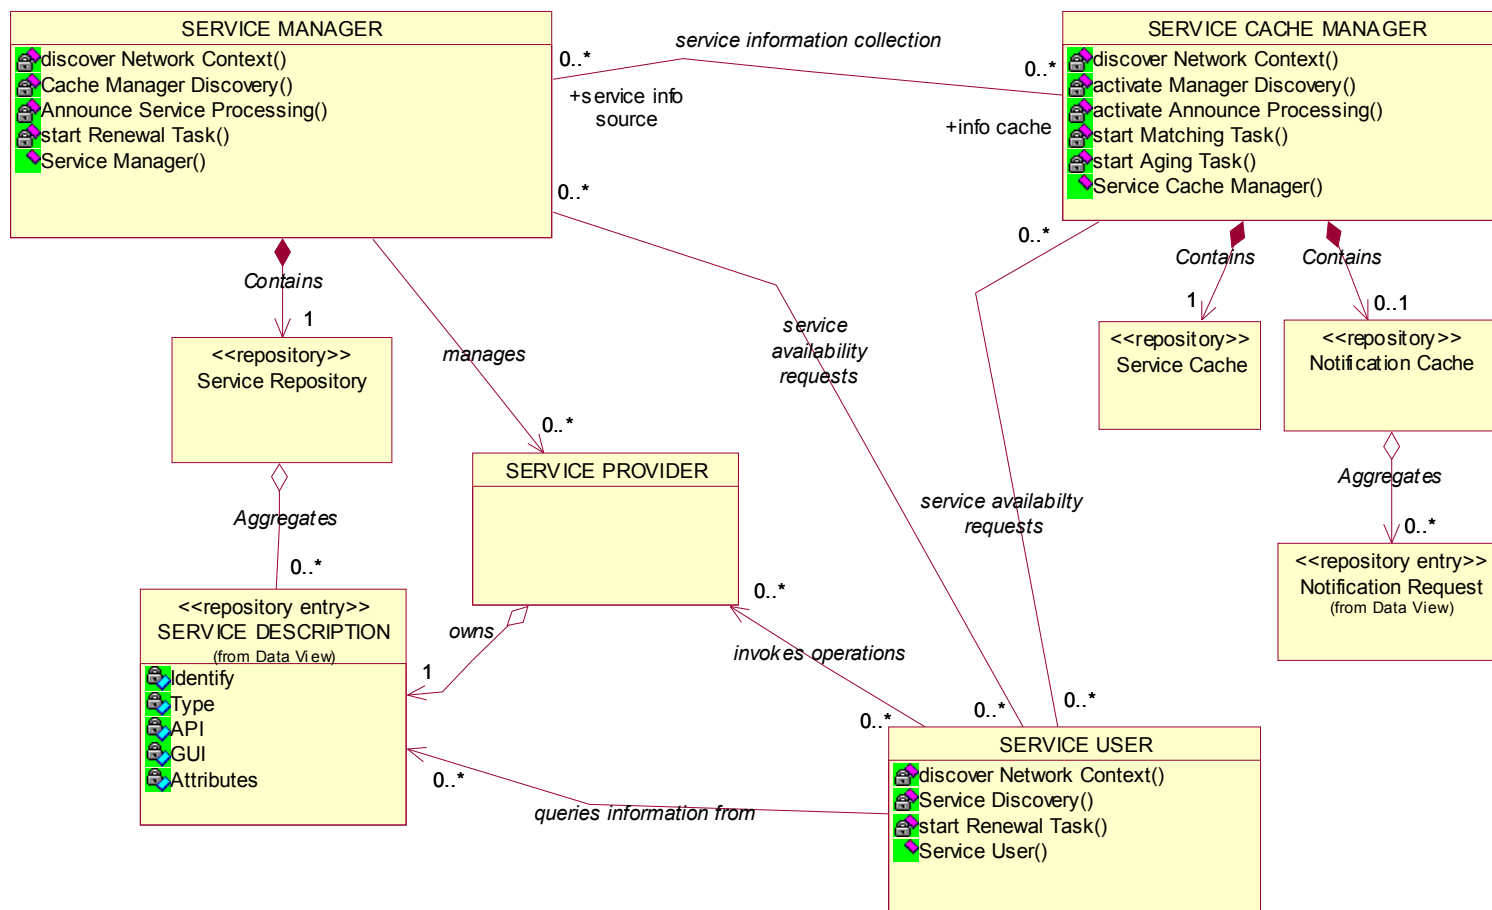

The diagram illustrates the relationships between various components in a Service Manager (SM) architecture. The components and their interactions are as follows:

- SERVICE MANAGER (from Structural View)** (Yellow box)
 - Invokes operations (0..*) on **<<Interface>> of SCM to Service MGR**.
 - Invokes operations (0..*) on **<<Interface>> of SM to Service User**.
 - Invokes operations (0..*) on **<<Interface>> of SM to Service**.
 - Invokes operations (0..*) on **SERVICE PROVIDER**.
 - Invokes operations (0..*) on **SERVICE USER**.
 - Invokes operations (0..*) on **<<Interface>> of SCM to Service User**.
 - Invokes operations (0..*) on **<<Interface>> of DESC to Service**.
 - Invokes operations (0..*) on **<<Interface>> of SM to Service MGR**.
 - Invokes operations (0..*) on **<<Interface>> of SM to Service Cache MGR**.
 - Invokes operations (0..*) on **SERVICE CACHE (from Structural View)**.
 - Invokes operations (0..*) on **LOCAL CACHE MANAGER**.
- <<Interface>> of SM to Service** (Blue box)
 - add Service Description()
 - change Service Description()
 - delete Service Description()
- <<Interface>> of SM to Service MGR** (Blue box)
 - add Service Description()
 - change Service Description()
 - delete Service Description()
 - <<OPT>> renew Service Description()
- <<Interface>> of SM to Service User** (Blue box)
 - find Service()
 - <<OPT>> add Service Parm Change Notification()
 - <<OPT>> renew Service Parm Change Notification()
 - <<OPT>> delete Service Parm Change Notification()
- <<Interface>> of SM to Service Cache MGR** (Blue box)
 - <<OPT>> service Description Expired()
- SERVICE PROVIDER** (Yellow box)
 - Invokes operations (1) on **<<Interface>> of DESC to Service**.
 - Invokes operations (0..*) on **SERVICE USER**.
- <<Interface>> of DESC to Service** (Yellow box)
 - set Attributes()
 - set API()
 - set GUI()
 - set Identity()
 - set Type()
- SERVICE USER (from Structural View)** (Yellow box)
 - Invokes operations (0..*) on **<<Interface>> of SM to Service User**.
 - Invokes operations (0..*) on **<<Interface>> of SU to MGR of Services**.
 - Invokes operations (0..*) on **LOCAL CACHE MANAGER**.
- <<Interface>> of SCM to Service User (from of DESC to Service User)** (Blue box)
 - <<OPT>> add Service Notification Request()
 - <<OPT>> renew Service Notification Request()
 - <<OPT>> delete Service Notification Request()
 - find Service()
- <<Interface>> of SU to MGR of Services** (Blue box)
 - service Matched Callback()
 - <<OPT>> service Notification Request Expired()
 - <<OPT>> service Parameter Change Matched()
- SERVICE DESCRIPTION (from Data View)** (Yellow box)
 - Identify
 - Type
 - API
 - GUI
 - Attributes
- <<Interface>> of DESC to Service** (Yellow box)
 - get Attributes()
 - get API()
 - get GUI()
 - get Identity()
 - get Type()
- LOCAL CACHE MANAGER (from Structural View)** (Blue box)
 - Start Aging Task()
- SERVICE CACHE (from Structural View)** (Blue box)
 - Invokes operations (0..*) on **<<Interface>> of SM to Service User**.
 - Invokes operations (0..*) on **<<Interface>> of SU to MGR of Services**.

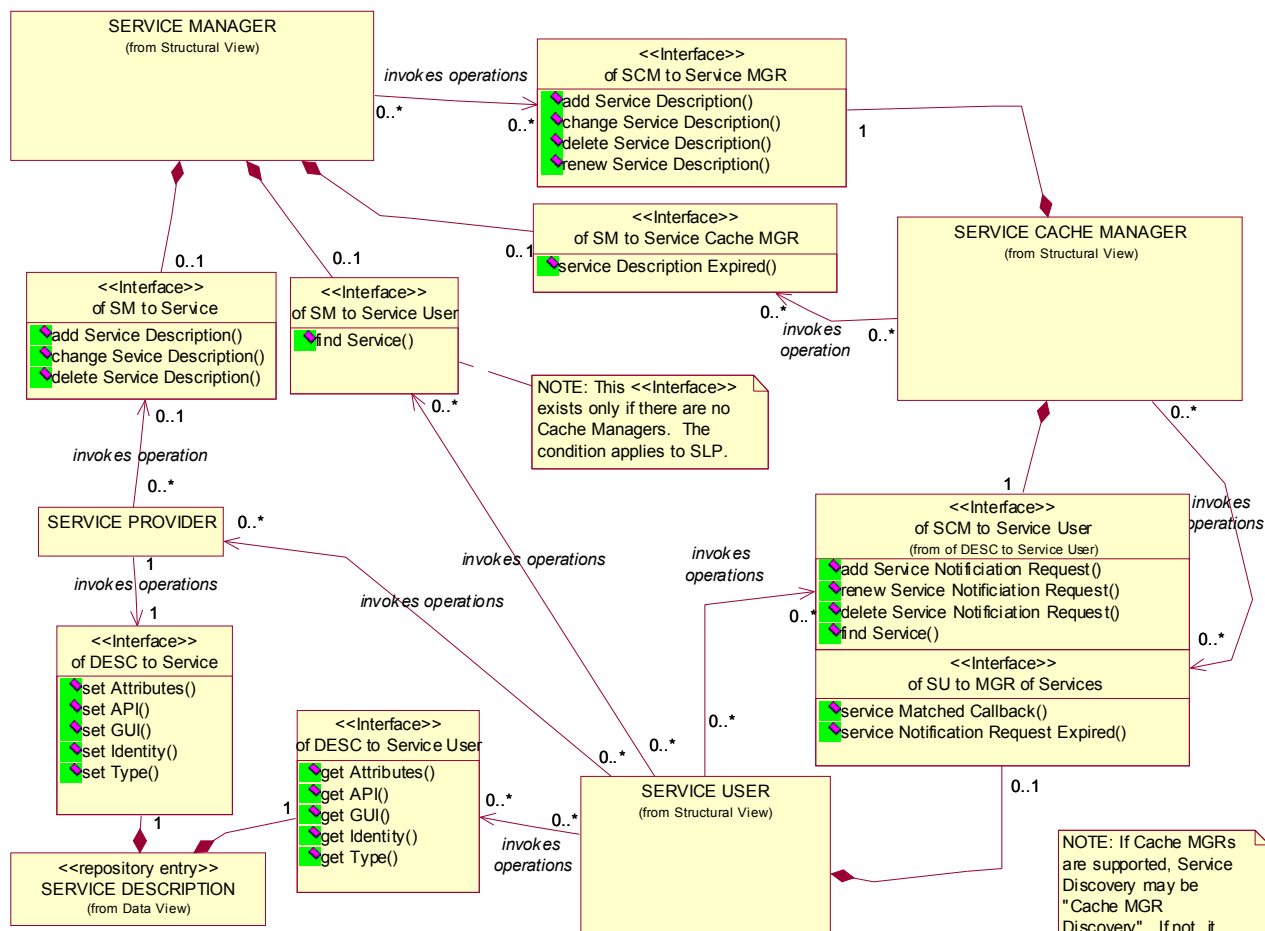

Notes:

- NOTE: This <<Interface>> exists only if there are no Cache Managers. The condition applies to SLP.
- NOTE: If Cache MGRs are supported, Service Discovery may be "Cache MGR Discovery". If not, it may be "Service Listening".

UML Structural Model of Jini

UML Functional Model of Jini

Plan to Assess Scalability

- Use Rapide Models as a Basis to Construct Simulation Models for Jini, UPnP and SLP, Possibly using JavaSim (from Ohio State University) or SSFnet (from Rutgers)
- Use Results from Measurement Portion of the Project to Parameterize the Simulation Models of the Discovery Protocols
- Design Experiments to Assess the Effect of Large Service and Device Populations on Network Traffic
